Corporate Vulnerability Management System

1. Web Interface Overview

The project has been extended with a user-friendly web interface designed to manage corporate IT security posture. The interface serves as a management console for security teams and IT operations to interact with the database without writing manual SQL queries.

- **Technology Stack:** The frontend is built using a modern web framework, connecting to the SQL Server backend via an application layer.
- **User Experience:** Navigation is divided into sections for Assets, Vulnerabilities, and Scans, reflecting the core clusters of our data analysis.

2. Business Rules Support

The web interface is designed to strictly enforce the business processes defined in the requirements analysis:

- **Remediation Workflow:** Users can only modify vulnerability statuses (e.g., closing a CVE) if they have group-level authorization for the specific asset.
- **Scan Scheduling:** The interface prevents scheduling scans for past dates, utilizing the logic embedded in our AddScan stored procedure.
- **SLA Visibility:** Remediation deadlines (SLAs) are clearly displayed, utilizing the vw_SLA_Breach_Report to highlight critical breaches.

3. Project Execution Instructions

3.1 Prerequisites

Before running the application, ensure the following environment is set up:

- **Database Server:** Microsoft SQL Server (2019 or later).
- **Database Setup:** The VulnerabilityDB must be created, and all tables, views, triggers, and stored procedures (SP 1 - SP 12) must be executed. Execute order:
 - VulnerabilityManagement.sql
 - Insert_Data.sql

- Views_Procedures_Trigger.sql
- **Web Server/Environment:** .NET Core Runtime 10.0.
- **Connectivity:** The database connection string in the configuration file must be updated to point to the local SQL instance.

3.2 Step-by-Step Run Instructions

1. **Database Restoration:** * Open SQL Server Management Studio (SSMS).
 - Execute the provided SQL script to build the schema and populate the sample data.
2. **Configuration:**
 - Navigate to the project's root folder.
 - Open the config or appsettings file.
 - Adjust the Server Name and Authentication (Windows or SQL Server Auth) to match your local environment.
3. **Launching the Interface:**
 - Open the terminal/command prompt in the project directory.
 - Run the launch command or Run from GUI. (dotnet run --project VulnerabilityManagement/VulnerabilityManagement.csproj)
 - Open a web browser and navigate to <http://localhost:5062> (or the specified port).
4. **Testing Business Rules:**
 - Log in using a sample PersonID (e.g., ID: 1 for Ahmet Yilmaz) to test the group-based security features.
 - Use the "Add Scan" form to verify that past dates are rejected by the system logic.

4. Operations and Code Behind

To ensure data integrity and security, all Create, Read, Update, and Delete (CRUD) operations on the web interface are handled through our Stored Procedures.

4.1.SP_AddAsset

```
[HttpPost]
public IActionResult CreateAsset(string fqdn, string ip, string os, string type, string ownerCompanyID)
{
    using (SqlConnection con = new SqlConnection(_connectionString))
    {
        // Step 3 Gereksinimi: Stored Procedure
        using (SqlCommand cmd = new SqlCommand("sp_AddAsset", con))
        {
            cmd.CommandType = CommandType.StoredProcedure;
            cmd.Parameters.AddWithValue("@fqdn", fqdn);
            cmd.Parameters.AddWithValue("@ip", ip);
            cmd.Parameters.AddWithValue("@os", os);
            cmd.Parameters.AddWithValue("@type", type);
            cmd.Parameters.AddWithValue("@companyCode", ownerCompanyID);

            con.Open();
            cmd.ExecuteNonQuery();
        }
    }
    return RedirectToAction("Assets");
}
```
